< <p>A

- Calculus grew out of four major problems that European mathematicians were working on during the seventeenth century.
  - The tangent line problem
  - 2 The velocity and acceleration problem
  - The minimum and maximum problem
  - The area problem
- Each problem involves the <u>notion of a limit</u> and calculus can be introduced with any of the four problems. Essentially, the problem of finding the tangent line at point *P* boils down to the problem of finding the slope of the tangent line at point *P*.

 If (c, f(c)) is the point of tangency and (c + Δx, f(c + Δx)) is a second point on the graph of f, then the slope of the secant line through the two points is given by substitution into the slope formula.

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$
$$m_{sec} = \frac{f(c + \Delta x) - f(c)}{(c + \Delta x) - c} = \frac{f(c + \Delta x) - f(c)}{\Delta x}$$

Szu-Chi Chung (NSYSU)

- The right-hand side of this equation is a difference quotient
- The denominator  $\Delta x$  is the change in x, and the numerator  $\Delta y = f(c + \Delta x) f(c)$  is the change in y.

#### Definition 2.1 (Tangent line with slope m)

If f is defined on an open interval containing c, and if the limit

$$\lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} = \lim_{\Delta x \to 0} \frac{f(c + \Delta x) - f(c)}{\Delta x} = m$$

exists, then the line passing through (c, f(c)) with slope m is the tangent line to the graph of f at the point (c, f(c)).

• The slope of the tangent line to the graph of f at the point (c, f(c)) is also called the slope of the graph of f at x = c.

#### Example 2 (Tangent lines to the graph of a nonlinear function)

Find the slopes of the tangent lines to the graph of  $f(x) = x^2 + 1$  at the points (0,1) and (-1,2).

< □ > < 同 > < 回 > < 回 > < 回 >

• The definition of a tangent line to a curve does not cover the possibility of a vertical tangent line. For vertical tangent lines, you can use the following definition. If *f* is continuous at *c* and

$$\lim_{\Delta x \to 0} \frac{f(c + \Delta x) - f(c)}{\Delta x} = \infty \quad \text{or} \quad \lim_{\Delta x \to 0} \frac{f(c + \Delta x) - f(c)}{\Delta x} = -\infty$$

the vertical line x = c passing through (c, f(c)) is a vertical tangent line to the graph of f.

• For example, the function shown in Figure 1 has a vertical tangent line at (c, f(c)).

Figure 1: The graph of f has a vertical tangent line at (c, f(c)).

Szu-Chi Chung (NSYSU)

- If the domain of f is the closed interval [a, b], you can extend the definition of a vertical tangent line to include the endpoints by considering continuity and limits from the right (for x = a) and from the left (for x = b).
- The above limit is also used to define the differentiation.

#### Definition 2.2 (The derivative of a function)

The derivative of f at x is given by

$$f'(x) = \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}$$

provided the limit exists. For all x for which this limit exists, f' is a function of x.

Szu-Chi Chung (	NSYSU)	
-----------------	--------	--

< □ > < □ > < □ > < □ > < □ > < □ >

- This "new" function gives the slope of the tangent line to the graph of f at the point (x, f(x)), provided that the graph has a tangent line at this point. The process of finding the derivative of a function is called <u>differentiation</u>.
- A function is <u>differentiable</u> at x if its derivative exists at x and is differentiable on an open interval (a, b) if it is differentiable at every point in the interval.

• In addition to f'(x), which is read as "f prime of x," other notations are used to denote the derivative of y = f(x). The most common are

$$f'(x), \quad \frac{\mathrm{d}y}{\mathrm{d}x}, \quad y', \quad \frac{\mathrm{d}}{\mathrm{d}x}[f(x)], \quad D_x[y].$$
 Notation for derivatives

• The notation dy/dx is read as "the derivative of y with respect to x" or simply "dy, dx." Using limit notation, you can write

$$\frac{\mathrm{d}y}{\mathrm{d}x} = \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} = \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} = f'(x).$$

#### Example 3 (Finding the derivative by the limit process)

Find the derivative of  $f(x) = x^3 + 2x$ .

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

#### Example 4 (Using the derivative to find the slope at a point)

Find f'(x) for  $f(x) = \sqrt{x}$ . Then find the slopes of the graph of f at the points (1,1) and (4,2). Discuss the behavior of f at (0,0).

### Example 5 (Finding the derivative of a function)

Find the derivative with respect to *t* for the function y = 2/t.

3

< □ > < 同 > < 回 > < 回 > < 回 >

# Differentiability and continuity

• The following <u>alternative limit form</u> of the derivative is useful in investigating the relationship between <u>differentiability</u> and continuity. The derivative of *f* at *c* is

$$f'(c) = \lim_{x \to c} \frac{f(x) - f(c)}{x - c}$$

Alternative form of derivative

provided this limit exists (see Figure 2).

Figure 2: As x approaches c, the secant line approaches the tangent line.

Szu-Chi Chung (NSYSU)

The derivative of f at c is given by

$$f'(c) = \lim_{\Delta x \to 0} \frac{f(c + \Delta x) - f(c)}{\Delta x}$$

Let  $x = c + \Delta x$ . Then  $x \to c$  as  $\Delta x \to 0$ . So, replacing  $c + \Delta x$  by x, you have

$$f'(c) = \lim_{\Delta x \to 0} \frac{f(c + \Delta x) - f(c)}{\Delta x} = \lim_{x \to c} \frac{f(x) - f(c)}{x - c}$$

• Note that the existence of the limit in this alternative form requires that the one-sided limits

$$\lim_{x \to c^-} \frac{f(x) - f(c)}{x - c} \quad \text{and} \quad \lim_{x \to c^+} \frac{f(x) - f(c)}{x - c}$$

exist and are equal. These one-sided limits are called the derivatives from the left and derivatives from the right, respectively.

Szu-Chi Chung (NSYSU)

< □ > < /□ >

- It follows that f is differentiable on the closed interval [a, b] if it is differentiable on (a, b) and if the derivative from the right at a and the derivative from the left at b both exist.
- If a function is not continuous at x = c, it is also not differentiable at x = c. For instance, the greatest integer function f(x) = ⌊x⌋ is not continuous at x = 0, and so it is not differentiable at x = 0

Figure 3: The greatest integer function is not differentiable at x = 0, because it is not continuous at x = 0.

• You can verify this by observing that

$$\lim_{x \to 0^{-}} \frac{f(x) - f(0)}{x - 0} = \lim_{x \to 0^{-}} \frac{\lfloor x \rfloor - 0}{x}$$
$$= \lim_{x \to 0^{-}} \frac{-1 - 0}{x} = \infty \quad \text{Derivative from the left}$$

and

$$\lim_{x \to 0^+} \frac{f(x) - f(0)}{x - 0} = \lim_{x \to 0^+} \frac{\lfloor x \rfloor - 0}{x}$$
$$= \lim_{x \to 0^+} \frac{0 - 0}{x} = 0.$$
 Derivative from the right

• Although it is true that differentiability implies continuity (later on), the converse is not true.

Szu-Chi Chung (NSYSU)

#### Theorem 2.1 (Differentiability implies continuity)

#### If f is differentiable at x = c, then f is continuous at x = c.

3

< □ > < 同 > < 回 > < 回 > < 回 >

#### Short summary

- We have two forms of derivative and the process of finding the derivative is called differentiation
- A function is differentiable at x if its derivative exists at x
- If a function is differentiable at x = c, then it is continuous at x = c. So, differentiability implies continuity.
- It is possible for a function to be continuous at x = c and not be differentiable at x = c. So, continuity does not imply differentiability. eg. f(x) = |x<sup>2</sup> 1| at x = ±1.

• Before proving the next rule, we review the procedure for expanding a binomial:

$$(x + \Delta x)^{2} = x^{2} + 2x\Delta x + (\Delta x)^{2}$$
$$(x + \Delta x)^{3} = x^{3} + 3x^{2}\Delta x + 3x(\Delta x)^{2} + (\Delta x)^{3}$$

• The general binomial expansion for a positive integer n is

$$(x + \Delta x)^n = x^n + nx^{n-1}(\Delta x) + \underbrace{\frac{n(n-1)x^{n-2}}{2}(\Delta x)^2 + \dots + (\Delta x)^n}_{(\Delta x)^2 \text{ is a factor of these terms.}}$$

< □ > < □ > < □ > < □ > < □ > < □ >

#### Theorem 2.3 (The Power Rule)

If n is a rational number, then the function  $f(x) = x^n$  is differentiable and

$$\frac{\mathrm{d}}{\mathrm{d}x}\left[x^{n}\right]=nx^{n-1}.$$

For f to be differentiable at x = 0, n must be a number such that  $x^{n-1}$  is defined on an interval containing 0.

- We will prove the case for which *n* is a positive integer greater than 1.
- You will prove the case for n = 1. In Section 2.3, it proves the case for which n is a negative integer. In Section 2.5, you are asked to prove the case for which n is rational. In Section 5.5, the Power Rule will be extended to cover irrational values of n.

• If *n* is a positive integer greater than 1, then the binomial expansion produces

э

A D N A B N A B N A B N

• When using the Power Rule, the case for which *n* = 1 is best thought of as a separate differentiation rule. That is,

$$\frac{\mathrm{d}}{\mathrm{d}x}[x] = 1.$$
 Power Rule when  $n = 1$ 

• This rule is consistent with the fact that the slope of the line *y* = *x* is 1, as shown in Figure 4.

Figure 4: The slope of the line y = x is 1.

#### 5 Implicit differentiation

#### Theorem 2.7 (The Product Rule)

The product of two differentiable functions f and g is itself differentiable. Moreover, the derivative of fg is the first function times the derivative of the second, plus the second function times the derivative of the first.

$$\frac{\mathrm{d}}{\mathrm{d}x}\left[f(x)g(x)\right] = f(x)g'(x) + g(x)f'(x)$$

• Some mathematical proofs, such as the proof of the Sum Rule, are straightforward. Others involve clever steps that may appear unmotivated to a reader. This proof involves such a step-subtracting and adding the same quantity.

Chapter 2 Differentiation

August 23, 2023 45 / 83

• If f, g, and h are differentiable functions of x, then

$$\frac{\mathrm{d}}{\mathrm{d}x}\left[f(x)g(x)h(x)\right] = f'(x)g(x)h(x) + f(x)g'(x)h(x) + f(x)g(x)h'(x).$$

#### Example 1 (Using the Product Rule)

Find the derivative of  $h(x) = (3x - 2x^2)(5 + 4x)$ .

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

#### Example 2 (Using the Product Rule)

Find the derivative of  $y = 3x^2 \sin x$ .

#### Example 3 (Using the Product Rule)

Find the derivative of  $y = 2x \cos x - 2 \sin x$ .

< □ > < □ > < □ > < □ > < □ > < □ >

#### Theorem 2.8 (The Quotient Rule)

The quotient f/g of two differentiable functions f and g is itself differentiable at all values of x for which  $g(x) \neq 0$ . Moreover, the derivative of f/g is given by the denominator times the derivative of the numerator minus the numerator times the derivative of the denominator, all divided by the square of the denominator.

$$\frac{\mathrm{d}}{\mathrm{d}x} \left[ \frac{f(x)}{g(x)} \right] = \frac{g(x)f'(x) - f(x)g'(x)}{[g(x)]^2}, \quad g(x) \neq 0$$

• As with the proof of Theorem 2.7, the key to this proof is subtracting and adding the same quantity.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

#### Example 7 (Proof of the Power Rule (negative integer exponents))

If *n* is a negative integer, there exists a positive integer *k* such that n = -k.

< □ > < □ > < □ > < □ > < □ > < □ >

## Derivatives of trigonometric functions

• Knowing the derivatives of the sine and cosine functions, you can use the Quotient Rule to find the derivatives of the four remaining trigonometric functions.

#### Theorem 2.9 (Derivatives of trigonometric functions)

 $\frac{d}{dx} [\tan x] = \sec^2 x \qquad \qquad \frac{d}{dx} [\cot x] = -\csc^2 x \\ \frac{d}{dx} [\sec x] = \sec x \tan x \qquad \qquad \frac{d}{dx} [\csc x] = -\csc x \cot x$ 

Considering  $\tan x = (\sin x)/(\cos x)$  and applying the Quotient Rule, you obtain

The proofs of the other three parts of the theorem are left as an exercise (see Exercise 87).

Szu-Chi Chung (NSYSU)

Chapter 2 Differentiation

August 23, 2023 54 / 83

#### Example 8 (Differentiating trigonometric functions)

**a.** 
$$y = x - \tan x$$

**b.**  $y = x \sec x$ 

#### Example 9 (Different forms of a derivative)

Differentiate both forms of  $y = \frac{1 - \cos x}{\sin x} = \csc x - \cot x$ .

▲□▶ ▲圖▶ ▲ 臣▶ ▲ 臣▶ 三臣 - のへの

The simplified form of a derivative after differentiation can be obtained as follows. Notice that the two characteristics of the form are the absence of negative exponents and the combining of like terms.

	f'(x) after differentiating	f'(x) after simplifying
Example 1	$(3x-2x^2)(4) + (5+4x)(3-4x)$	$-24x^2 + 4x + 15$
Example 3	$(2x)(-\sin x) + (\cos x)(2) - 2(\cos x)$	$-2x \sin x$
Example 4	$\frac{(x^2+1)(5)-(5x-2)(2x)}{(x^2+1)^2}$	$\frac{-5x^2+4x+5}{(x^2+1)^2}$
Example 5	$\frac{(x^2+5x)(3)-(3x-1)(2x+5)}{(x^2+5x)^2}$	$\frac{-3x^2+2x+5}{(x^2+5x)^2}$
Example 9	$\frac{(\sin x)(\sin x) - (1 - \cos x)(\cos x)}{\sin^2 x}$	$\frac{1-\cos x}{\sin^2 x}$

- You can define derivatives of any positive integer order. For instance, the second derivative is the derivative of the first derivative.
- Higher-order derivatives are denoted as follows.

First derivative:	y′,	f'(x),	$\frac{\mathrm{d}y}{\mathrm{d}x}$ ,	$\frac{\mathrm{d}}{\mathrm{d}x} [f(x)],$	$D_x[y]$
Second derivative:	y″,	f''(x),	$\frac{\mathrm{d}^2 y}{\mathrm{d}x^2}$ ,	$\frac{\mathrm{d}^2}{\mathrm{d}x^2} [f(x)],$	$D_x^2[y]$
Third derivative:	y‴,	f'''(x),	$\frac{\mathrm{d}^3 y}{\mathrm{d}x^3}$ ,	$\frac{\mathrm{d}^3}{\mathrm{d}x^3} [f(x)],$	$D_x^3[y]$
Fourth derivative:	y <sup>(4)</sup> ,	$f^{(4)}(x),$	$\frac{\mathrm{d}^4 y}{\mathrm{d}x^4}$ ,	$\begin{array}{c} \frac{\mathrm{d}}{\mathrm{d}x} \left[ f(x) \right], \\ \frac{\mathrm{d}^2}{\mathrm{d}x^2} \left[ f(x) \right], \\ \frac{\mathrm{d}^3}{\mathrm{d}x^3} \left[ f(x) \right], \\ \frac{\mathrm{d}^4}{\mathrm{d}x^4} \left[ f(x) \right], \end{array}$	$D_x^4[y]$
	÷				
<i>n</i> th derivative:	y <sup>(n)</sup> ,	$f^{(n)}(x),$	$\frac{\mathrm{d}^n y}{\mathrm{d} x^n},$	$\frac{\mathrm{d}^n}{\mathrm{d}x^n} \ [f(x)],$	$D_x^n[y]$

- This text has yet to discuss one of the most powerful differentiation rules—the Chain Rule. This rule deals with composite functions.
- For example, compare the functions shown below. Those on the left can be differentiated without the Chain Rule, and those on the right are best differentiated with the Chain Rule.

Without the Chain Rule	With the Chain Rule
$y = x^2 + 1$	$y = \sqrt{x^2 + 1}$
$y = \sin x$	$y = \sin 6x$
y = 3x + 2	$y = (3x + 2)^5$
$y = x + \tan x$	$y = x + \tan x^2$

Szu-Chi Chung (NSYSU)

#### Theorem 2.10 (The Chain Rule)

If y = f(u) is a differentiable function of u and u = g(x) is a differentiable function of x, then y = f(g(x)) is a differentiable function of x and

$$\frac{\mathrm{d}y}{\mathrm{d}x} = \frac{\mathrm{d}y}{\mathrm{d}u} \cdot \frac{\mathrm{d}u}{\mathrm{d}x}$$

or, equivalently,

$$\frac{\mathrm{d}}{\mathrm{d}x} \left[ f(g(x)) \right] = f'(g(x))g'(x).$$

イロト イポト イヨト イヨト 二日

## f(g(x)) u = g(x) y = f(u)**a.** $y = \frac{1}{x+1}$ **b.** $y = \sin 2x$ **c.** $y = \sqrt{3x^2 - x + 1}$

**d.** 
$$y = \tan^2 x$$

#### Example 3 (Applying the chain Rule)

Find  $\frac{\mathrm{d}y}{\mathrm{d}x}$  for  $y = (x^2 + 1)^3$ .

### The General Power Rule

- One of the most common types of composite functions is  $y = [u(x)]^n$ .
- The rule for differentiating such functions is called the General Power Rule, and it is a special case of the Chain Rule.

#### Theorem 2.11 (The General Power Rule)

If  $y = [u(x)]^n$ , where u is a differentiable function of x and n is a rational number, then

$$\frac{\mathrm{d}y}{\mathrm{d}x} = n[u(x)]^{n-1}\frac{\mathrm{d}u}{\mathrm{d}x}$$

or, equivalently,

$$\frac{\mathrm{d}}{\mathrm{d}x}\left[u^{n}\right]=nu^{n-1}u'.$$

- 3 Product and Quotient Rules and higher-order derivatives

4 The Chain Rule

#### 5 Implicit differentiation

< □ > < 同 > < 三 > <

## Implicit and explicit functions

• Most functions have been expressed in explicit form. For example, in the equation

$$y = 3x^2 - 5$$
 Explicit form

the variable y is explicitly written as a function of x.

• Some functions are only implied by an equation. For instance, the function y = 1/x is defined implicitly by the equation xy = 1. Suppose you were asked to find dy/dx for this equation. You could begin by writing y explicitly as a function of x

Implicit Form	Explicit Form	Derivative
xy = 1	$y = \frac{1}{x} = x^{-1}$	$\frac{\mathrm{d}y}{\mathrm{d}x} = -x^{-2} = -\frac{1}{x^2}$

• We cannot, however, use this procedure when you are unable to solve for y as a function of x.

イロト イポト イヨト イヨト 二日

• For instance, how would you find dy/dx for the equation

$$x^2 - 2y^3 + 4y = 2$$

where it is very difficult to express y as a function of x explicitly? To do this, you can use implicit differentiation.

- To understand how to find dy/dx implicitly, you must realize that the differentiation is taking place with respect to x.
- When you differentiate terms involving y, you must apply the Chain Rule, because you are assuming that y is defined implicitly as a differentiable function of x!

#### Example 1 (Differentiating with respect to x)

**a.**  $\frac{\mathrm{d}}{\mathrm{d}x} \left[ x^3 \right]$ 

**b.**  $\frac{d}{dx} [y^3]$ 

c.  $\frac{\mathrm{d}}{\mathrm{d}x}[x+3y]$ 

**d.**  $\frac{\mathrm{d}}{\mathrm{d}x}[xy^2]$ 

э

< □ > < □ > < □ > < □ > < □ >

#### Guidelines for implicit differentiation

- **1** Differentiate both sides of the equation with respect to *x*.
- Collect all terms involving dy/dx on the left side of the equation and move all other terms to the right side of the equation.
- Solution Factor dy/dx out of the left side of the equation.

• Solve for dy/dx.
